# The share (%) of agri-food products in total world trade of all products

During the COVID 19 pandemic in 2020, the world trade of all products decreased by more than USD 1 trillion, but the trade of food products increased by USD 28 billion. Therefore, the share of food products in the world trade of all products increased to its highest level at 9.4% in the past 20 years.

This is an indicator of the resilience of global food trade.

|                              | Unit: 1000 USD |                |
|------------------------------|----------------|----------------|
|                              | 2019           | 2020           |
| All Products                 | 18,736,223,963 | 17,271,017,748 |
| Food Products                | 1,591,325,696  | 1,619,034,950  |
| Food share from all products | 8.5%           | 9.4%           |

# International trade is mostly linked to which SDGs?

## Different conditions for the positive and negative outcomes on the SDGs

International trade is mostly linked to **SDG 8** (Decent Work and Economic Growth), followed by **SDG 13** (Climate Action), and **SDG 9** (Industry, Innovation and Infrastructure)

| Conditions for positive and negative outcomes |                                      |
|---|--------------------------------------|
| Positive                                      | Negative                             |
| Liberalised and privatised sector             | Strong state intervention            |
| Enforced standards both public and private    | Limited standard enforcement         |
| Strong foreign direct investments             | Rudimentary private investment       |
| Vertical integration                          | Weak coordination along supply chain |

# Direct and indirect linkage, positive and negative outcomes

**Strong foreign direct investments** → direct linkage to **SDG 8** and **SDG 9**

→ **positive outcomes**: economic growth, employment opportunities, access to markets

→ E.g., in Indonesia, agro-industrial oil palm plantations are an important driver of economic development since they provide employment in rural areas and contribute to state revenues.

Infrastructure development (e.g., feeder roads) links rural areas with urban areas, relevant markets, and marketplaces for direct sales as well as improves access to inputs and energy for smallholders.

**Limited standard enforcement** → indirect linkage to **SDG 13** and **SDG 15**

→ **negative outcomes**: deforestation, loss of biodiversity, land grabbing

→ E.g., carbon sequestration and storage are important ecosystem services since deforestation of peatlands due to the rapid expansion of oil palm plantations result in an increase in GHG emissions. In addition, habitat for species are destroyed due to land conversion. There have been over 600 land disputes in Indonesia between local communities and palm oil companies due to the granting of new concessions for oil palm plantations in primary forests and peatlands.

| Degree of coordination                     |  |                                       |                        |                          |
| Product and quality differentiation        |  |                                       |                        |                          |

General commodities provide the common characteristics, but specific products make the results more exact and meaningful; thus, we are proposing to focus on **specific products** for the four types of GVC.
