Council for Agricultural Research and Economics

Trade
4 SUSTAINABLE DEVELOPMENT

Deliverable 2.3:
Database and infographics on standards rapprochement: STCs and the bilateral measure of distance on pesticides and antibiotics

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

TRADE4SD

Fostering the positive linkages between trade and sustainable development

Programme: H2020-EU.3.2.1.3. - Empowerment of rural areas, support to policies and rural innovation
Topic: RUR-21-2020 - Agricultural markets and international trade in the context of sustainability objectives
Call: H2020-RUR-2020-2
Type of action: Research and Innovation Action (RIA)
Duration of the project: 01 June 2021 – 31 May 2025

Deliverable 2.3:
Database and infographics on standards rapprochement: STCs and the bilateral measure of distance on pesticides and antibiotics

Federica Demaria[*1], Maria Rosaria Pupo D'andrea[1], Annalisa Zezza[1], Alessandra Ciccozzi[1] in kind contribution Sophie Drogué[2], Eleonora Russo[3]

[*]WP Leader, Task Leader, Deliverable leader

TASK 2.3 IN-DEPTH UPDATED ASSESSMENT OF SPS RECIPROCITY OF STANDARDS TO CREATE A LEVEL PLAYING FIELD

The objective of this task is three-fold: a) to develop an innovative measure of distance in terms of Maximum Residual Level (MRLs) with regard to regulations on pesticides, based on an adjusted bilateral distance between the EU and its own trade partners. The measure considers not only MRLs but also the number of substances, the level of toxicity, and the category of pesticides authorized in each country; b) to develop a new measure of distance in veterinary products regulations for animal production, based on the divergence of national regulations on veterinary products, focusing on antibiotics use; c) an analysis of Specific Trade Concerns (STCs) submitted to the WTO: analysis of selected law cases (EU-China, EU-India, EU-Senegal.

The SPS Agreement allows WTO members "to provide the level of health protection they deem appropriate" while ensuring that it does not result in overly restrictive trade measures.

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

Task 2.3.1: Harmonization of MRL of pesticides in vegetable products

2.3.1 Measuring Distance in MRLs Pesticides

Despite major advances in the development of global standards and common conformity assessment under the institutions recognized in the WTO international trade rules on standards and regulations (Technical Barrier to Trade –TBT and Sanitary and Phytosanitary –SPS Agreements), domestic and import regulations continue to differ from country to country. While encouraging governments to orientate their import requirements towards internationally agreed standards, WTO rules recognize the right of countries to maintain their own standards, as long as they are non-arbitrary (science-based), non-discriminatory and least trade-restricting. Individual countries thus remain the main regulatory authorities on food standards (including food safety standards).

The SPS Agreement of the WTO recognizes the right of Member States to adopt specific SPS measures with the aim of protecting human, animal, and plant life or health. According to the SPS agreement, food safety standards include all relevant laws, decrees, regulations, requirements and procedures including, inter alia, end product criteria; processes and product methods; testing, inspection, certification, and approval procedures; quarantine treatments including relevant requirements associated with the transportation of animals and plants, or with the materials necessary for their survival during transport; provisions on relevant statistical methods, sampling procedures and methods of risk assessment; and packaging and labeling requirements directly related to food safety.

Sanitary and phytosanitary measures include e.g. regulations on maximum residue limits (MRL) of substances such as insecticides and pesticides. MRLs of pesticides are intended to protect consumers' health and to ensure the adoption of good practices by farmers.

According to WTO rules, SPS measures should be based on (i) international standards such as those of the Codex Alimentarius, (ii) science, including assessment of risk, (iii) a temporary principle of precaution in the absence of international standards or scientific evidence. Countries are free to set their own standards based on science. Consequently, each country establishes MRL autonomously based on national conditions and good agricultural practices. Hence, the number of regulated substances and their MLR may differ from country to country and a pesticide permitted in one country may be non-regulated in another. The approval process in each country is based on field studies on the quantity of residue levels which could remain in the product after harvest in the worst case and on consumption characteristics. Therefore, non-harmonization can be due to national specificities. For instance, according to a specific country's national dietary exposure assessment, estimates of exposure can be considered acceptable or not acceptable based on health-based guidance values. The value of the MRL will depend on the results of this analysis where some countries will adopt international standards (Codex value) or higher MRL while others will set lower, more protective, MRL or even adopt the zero-tolerance policy. In the latter case, the limit of determination (LOD) is binding. Differences in MRLs across countries may also be due to the level of technological advancement enjoyed by the country

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

implementing the regulation. For richer or more technologically "advanced" countries is easier to comply with lower MRL because of more refined pesticide residue monitoring and analysis technologies.

The question of the non-harmonization of standards has been already studied in the literature on international trade. The measurement of harmonization or reciprocity of standards has been the subject of a stream of recent investigations on heterogeneity across countries for SPS and standard-like NTM regimes, using MLRs and other policies that can be aggregated meaningfully. This goes beyond simple counts of NTMs and looks at stringency in deviation either from international standards (Li & Beghin 2014) or from another reference value such as the highest value (Liu & Yue 2013) to gauge unusual stringency, if not protectionism. Bilateral heterogeneity of policies is also measured with the presumption that heterogeneity in regulation impedes trade (Liu & Yue 2013, Vigani et al. 2012), especially asymmetric heterogeneity when one country is more stringent than another (De Faria & Wieck 2014). Several distance measures are used. Drogué and DeMaria (2012) use a Pearson correlation coefficient of pesticide residue limits per product between any two countries trading the product. Winchester et al. (2012) use the Gower index, which takes the sum over policies of the absolute value of the difference in policy requirements between any pair of countries, normalized by the maximum difference in the data set between any two countries. Several heterogeneity indices can be developed for different types of regulations affecting sectors, and their separate effects can be econometrically assessed. Other analyses of harmonization and reciprocity use deviation from ISO standards as an indicator or lack thereof (Curzi et al. 2018), or they use adherence to ISO standards and mutual recognition of certification as a harmonized certification mechanism (Blind et al. 2013, Czubala et al. 2009). Curzi et al. (2018), following the methodology developed by Li and Beghin (2014), compare the restrictiveness of standards of a given country with the one imposed by the Codex Alimentarius. In all sectors considered in the analysis, the EU shows, on average, a higher score than other OECD and non-OECD countries, except for coffee, tea, and spices, where the average score is slightly lower than in OECD countries. The scores of OECD countries are, on average, higher than those of non-OECD in all sectors.

Some authors have looked at the economic and political determinants of MRLs beyond public health arguments. According to Li, Xiong, and Beghin (2017), high-income countries with large populations tend to adopt more stringent MRLs. Furthermore, stricter MRLs are established for strategic and competitive sectors, and MRLs and import tariffs may behave as substitutes for policy tools. Carrere et al. (2018) and Karema et al. (2021) try to explain whether or not MRLs are determined by “precautionary legitimate objectives”, showing that public health expenditures play a stronger role in the setting of stricter MRL for hazardous substances than the level of income.

The European Farm to Fork Strategy (F2F) has reinforced the policy objective of reducing the use of pesticides in food production, setting two new targets: a 50% reduction in the use and risk of chemical pesticides and a 50% reduction in the use of more hazardous pesticides by 2030 while, at the same time, preventing pollution

This project has received funding from the European Union’s Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

leakage through imports. This calls for a better understanding of the heterogeneity of regulations on pesticides worldwide and the impact of more stringent EU rules in terms of standards harmonization. At the moment is possible to set or maintain MRLs above the limit of quantification of residues for substances not approved in the Union. As a result, food or feed containing residues of substances prohibited in the EU can be legally placed on the market, as long as the levels of residues remain below the applicable MRLs.

The MRL Regulation defines the 'maximum residue level' (MRL) as the upper legal level of a concentration for a pesticide residue in or on food or feed based on good agricultural practice, and the lowest consumer exposure necessary to protect vulnerable consumers. Unlike approval for an active substance which requires environmental risks to be considered, MRLs are established solely on health grounds ('to protect vulnerable consumers') and do not consider environmental risks.

In the F2F strategy, the Commission indicated its willingness to consider environmental risks when assessing requests for import tolerances for pesticide residues in imported food, as well as to review import tolerances for substances meeting the cut-off (hazard-based) criteria in the Pesticides Regulation. This may require a revision of the Maximum Residue Limits Regulation in order to strengthen its environmental dimension and make relevant alignments with the pesticide's approval process.

The ambition of the EU is to raise the level of standards in exporting countries. There are positive examples in this direction, i.e. Canadian grain, oilseed, and pulse producers introduced a 'Keep it Clean' campaign given the introduction of low import tolerances for particular pesticides (e.g. glyphosate) in the import market.

Whether an exporting country is willing to conform to EU standards or not will presumably depend on (a) how costly compliance is, and (b) the importance of the EU as an export market for its products.

Standards may differ because countries interpret the science differently (which in turn may be a function of the strength of vested interests affected by these standards in each country), because of their different exposure to specific risks or different risk preferences or risk management approaches.

Until now, the EU has set MRLs for pesticide residues to ensure that imported products do not pose a health risk to its own population. Approval of active substances in addition takes account of any impacts they may have on the EU's own environment.

The measurement of harmonization or reciprocity of standards has been the subject of a stream of recent investigations on heterogeneity across countries for SPS and standard-like NTM regimes, using MLRs and other policies that can be aggregated meaningfully. Several indicators have been used in the literature to measure the impact of standards on trade.

MRLs are proposed by EFSA based on a risk assessment while considering international standards as developed in the Codex Alimentarius (CA). For active substances that are not approved at the EU level, either because they are deemed to have adverse consequences for health or the environment, or because no specific MRL has been set (due, for example, to the absence of data (trials) on uses), EU legislation requires that MRLs

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

should be set at a default value at 0.01 mg/kg which is deemed to be the lowest concentration that is detectable in testing.

The new measure of MLR distance between the two countries we are proposing allows us to analyze the impact on agricultural trade of different levels of stringency pesticides regulation in each country. Indeed, a more accurate measure of the level of harmonization in MLR regulation can shed light on the nature of Non-Tariff Barriers (NTBs) and better inform the debate on the rapprochement of food safety standards.

2.3.1.1. Data and research methodology

Several indicators have been used in the literature to measure the impact of standards on trade. In theory, every tariff line product can be potentially affected by different standards in place. Being the majority of products subject to more than one regulatory measure, the simplest way to consider sanitary, phytosanitary,y and technical requirements is just considering the presence/nonpresence of standards. This simple indicator known as "the coverage" and "frequency" ratio, have been used in the work of de Frahan and Vancauteren, 2006; Disdier et al., 2008; Fontagné et al., 2005 and Moenius, 2004. Other methods consist in evaluating the level of stringency of standards and regulations by the scale addressed by the issue concerned in the regulation (Otsuki et al, 2001a; Otsuki et al, 2001b; Xiong and Beghin, 2012).

However, literature has developed more sophisticated indicators with the objective of obtaining more precise measures of the level of similarity of regulations potentially affecting trade (Achterbosch et al., 2009; Vigani et al. 2011; Winchester et al. 2012; Drogué and DeMaria 2012, DeMaria and Drogué 2017).

One of the limits of existing measures is that they do not account for the level of toxicity of each pesticide and the pesticides typology, i.e in computing the distance between two countries a large distance between a highly toxic substance has the same weight as a large distance between a lesser toxic substance. With the aim of filling this gap, we propose the following adjusted distance (AD) between the two countries i and j ($i \neq j$) for product k and a class of pesticides h:

$$AD_{ijkhf} = \frac{1}{N_{Kfh}} \left(\sum_{s \in h} \frac{MRL_{i,k,s} - MRL_{j,k,s}}{Max(MRL_{i,k,s,f}) - Min(MRL_{i,k,s,f})} \right) (1)$$

Where N_{kh} denotes the number of chemicals in chemical class *h* used in the production of commodity *k*. MRL_{iks} is the MRL set in the exporting country *i* for pesticides *s* and product *k*. MRL_{jks} is the MRL set in the importing country *j* for pesticides *s* and product *k*. $Max(MRL_{iksf})$ is the greatest MRL for product *k* and substance *s* for typology *f* and $Min(MRL_{iksf})$ is the lowest MRL for the same pair of product/ substance. In doing so, our measure varies by product/country pairs and by type of chemical class and toxicity level.

MRLs are proposed by EFSA based on a risk assessment while taking into account international standards as developed in the Codex Alimentarius (CA). For active substances that are not approved at the EU level, the regulation sets MRLs at 0.01 mg/kg which is deemed to be the lowest concentration that is detectable in testing.

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

By the end of 2018 MRLs were established for 486 substances approved in the EU and 247 non-approved substances on a broad range of agricultural commodities.

The index equals 0 when both importing country and exporting country share the same MRLs for a given product. It equals 1 when the importing country has the most restrictive MRLs in comparison to the exporting country. It equals -1 when the exporting country has the most restrictive MRLs than the importing country.

With regard to missing values (table1), when a substance is not regulated in one country, we apply the following rules:

1) If a substance is not specified but countries have declared a default value, we replace the missing value with the default.
2) If the importing country does not regulate a specific substance and the exporting country does, we replace this value with the one regulated by the exporting country and the AD distance is null (as country i has no effort to make in order to reach the level of regulation of country j).
3) if the importing country regulates a specific substance and the exporting country does not, we replace the missing of the exporting country with the maximum MRL for the same product/ substance pair in the database. Country j must make the maximum effort to reach the level of regulation of country j.

These rules allow us to consider the "efforts" the exporter must make to access its partners' markets.

Table 1: Rules for missing MRL values

MRL exporter	MRL importer	Rules
Existing and > MLR importer	Existing	MRL Codex or default values
Existing and < MLR importer	Existing	MRL importer
Missing	Existing	MRL exporter = Max MRL
Existing	Missing	MRL importer = MRL exporter
Missing	Missing	MRL importer = MRL exporter = Max MRL

For our purpose, we utilize the database Agrobase-Logigram's Homologa, which provides data for 80 countries and 120 000 products (Table 2). The number of regulated substances is constantly increasing over time. The EU, Japan, and Switzerland regulate the largest number of pesticides whereas Thailand, countries of the Gulf Cooperation Council, and ASEAN countries have a much lower number (78, 3,0 and 76, respectively). South Korea, Turkey, and Norway have increased the number of regulated substances between 2008 and 2020. The reason why the USA, Australia, and Argentina show a lower number of regulated substances depends on the fact that the database does not show MLR when MLRise equal to 0. Indeed, countries follow different rules

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

when not specifying an MLR for a given substance (Table 3), as residues can be: a) equal to 'zero'; b) below a specified default limit (generally 0.01 mg/kg); c) below the concentration of dietary intake concern; d) equal to the MLR of the importing country when exporting to that country.

Table 2: Number of pesticides registered between 2008 and 2020

Country	2008	2016	2020
Argentina	263	324	327
ASEAN	60	78	76
Australia	366	388	462
Brazil	303	331	295
Canada	201	304	348

Table 3: Default value for missing MRLs by Country

	Rule when a pesticide is not registered
Argentina	1- Codex 2- Zero-tolerance
Australia	Zero-tolerance
Brazil	Codex
Canada	Default limit of 0.1 mg/kg
Chile	Codex

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

China	1- Codex 2- Limits applied by reference countries (EU, USA)
EU	Default limit of 0.01 mg/kg
India	No default limit. if no MRL exists, Codex MRL may be recognised.
Indonesia	If no MRL exists, Codex MRL applies.
Israel	If no MRL exists, Codex MRL applies.
Japan	Default limit of 0.01 mg/kg
Korea	1- Codex 2- Limit of most similar group of products 3- Default limit of 0.01 mg/kg
Malaysia	If no MRL exists, Codex MRL applies or a default MRL of 0.01 mg/kg applies.
Mexico	Zero-tolerance
New Zealand	1- Codex recognized for imported food 2- Australian MRLs recognized for food imported from Australia. 3- Default limit of 0.1 mg/kg applies
Norway	EU limit
Philippines	No default limit
Russia	1- Codex 2- Memorandum with Chile and the EU 3- MRL of the most similar product 4- MRL of the country of origin
Singapore	If no MRL exists, Codex MRL applies.
South Africa	EU limit
Switzerland	EU limit
Thailand	If no MRL exists, Codex MRL applies.
USA	Zero-tolerance
Vietnam	If no MRL exists, Codex MRL applies [Vietnam banned substances, including captan, endosulfan and methyl-parathion are not to be used/prohibited for exports to Vietnam].

Here we can distinguish 4 different toxicity categories as specified in Table 4.

Table 4: Description of toxicity classification and typology of pesticides.

Toxicity Class	Definition	Typology
Ndia	Highly toxic	Fungicides/Insecticides/Herbicides
Ndib	Toxic	Fungicides/Insecticides/Herbicides
Nmoderate	Moderately toxic	Fungicides/Insecticides/Herbicides
Nslightly	Slightly toxic	Fungicides/Insecticides/Herbicides

Sources: Author analysis and computation based on WHO and Homologa data

2.3.1.2 Results

The distance is computed between the EU and its own partners for specific products in the commodity groups of Cereals, Fruit, and vegetables in the last available year. The index depends on the number of regulated pesticides, their toxicity class in specific typologies, and the value of the MLRs. Additionally, it is also affected by the treatment of missing values that normally have been neglected. Our analysis shows a certain heterogeneity degree; indeed, harmonization in higher toxicity classes is higher for the typology of pesticides that are most used as fungicides in comparison to the others. More standards harmonization could stimulate

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

trade relationships and increase food safety globally. Moreover, some of the results could be also affected by the role of the products' consumption.

Results are reported in the infographics section.

Task 2.3.2: Antimicrobial resistance and legislation related to the use of antibiotics in livestock farming in the EU and its main trading partners: a quantitative measure of the divergence between standards.

2.3.2 Measuring Distance in MRLs Antibiotic Regulations

The issue of antimicrobial resistance is one of the most important challenges for human and animal health and food safety at a global level. The regulations on the use of antibiotics in meat products are not uniform around the world and differ between countries generating problems related to the marketing of products in the agri-food chain.

The antimicrobials' use in animals can lead to antimicrobial resistance (AMR) in humans through direct and indirect transmission mechanisms, such as exposure to livestock infected with AMR pathogens or through contaminated retail meat (Woolhouse et al., 2015).

Livestock producers have been encouraged to decrease the use of antibiotics in their production systems because of the increasing global concern about AMR and the potential risks to human health and animal health (WHO, 2015). The high use of antibiotics is the single most important factor driving the emergence of resistance. Antibiotics are used not only to treat sick animals but also for sub-therapeutic purposes such as in the prevention of disease and the promotion of growth. Additionally, the use of antibiotics overuse in animal production, is also related to the production system's typology. Indeed, sometimes the highest use of antibiotics is in systems having poor sanitary and management standards. Literature has emphasized AMR identified in animals, seafood, fertilizers, agricultural outputs, soil, water, pets, and food. The production and consumption of livestock products are at the core of the environmental, human health, and animal welfare debate. The empirical evidence suggests the strict interaction between the livestock sector and the UN Sustainable Development Goals (SDGs). The antibiotic resistance in food production, indeed, could be transmitted in the chain, in the farm, in the slaughtering phase, and during processing or preparation.

AMR has the potential to affect almost all SDGs, particularly those targeting poverty, hunger, health and economic growth, water and sanitation, consumption, and production.

The inclusion of AMR under the goal "Good Health and Well-being" stresses the increasing interest of the global community to tackle AMR. But it requires strong global coordination to monitor and regulate the use of antimicrobials in livestock production to mitigate AMR (Rogers Van Katwyk et al., 2016). While Goal number 6 ("Clean water and sanitation") highlights the need to introduce effective action to introduce quality and sustainability of water resources. Antibiotic residues derived from waste products or from hospitals, agriculture manufacturing plants, etc, can be transported by water, through sediment and soil, helping to select

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

highly resistant bacteria. Goal number 12 ("Ensuring sustainable consumption and production models") refers to the fact that antibiotics must be considered a very scarce and potentially non-renewable global resource. Goal number 17 ("Strengthen the means of implementation and revitalize the global partnership for sustainable development") concerns that AMR urgently requires political and institutional coherence at all policy levels.
In combatting antibiotic resistance, one of the main strategies is the "One Health" approach aimed at the creation and implementation of programs, policies, and laws to improve public health. The EU, through the Farm to Fork (F2F) strategy, aims at reducing the use of antibiotics by 50% by 2030 in farms.
Progress has been made, particularly, in Europe where Regulation 2019/6 established rules for the sale, manufacture, import, export, supply, distribution, control, and use of veterinary medicinal products. Article 107 introduces a general principle that antimicrobials cannot be used routinely or to compensate for poor husbandry.
In the analysis of the regulations, we follow the literature, and we compute a measure able to capture the divergences between rules on antibiotics MRLs between the EU and its own trade main partners (Ferro et al. 2015; Li and Beghin, 2014; Winchester et al., 2012; Drogué and Demaria, 2012).
We focus on divergences in the EU, Brazil, and the USA with the EU used as the benchmark.

Brazil	**USA**
Regulation n.41 of 23 October 2017 establishes the "Agroprevine" program, which promotes: 1) Surveillance and monitoring of antimicrobial resistance and antimicrobial use; 2) Strengthen the implementation of infection prevention and control measures; 3) Rational use of antimicrobials.	1) 2012: FDA issues, CVM GFI #209 which focus on the use of medically important antimicrobial drugs in food-producing animals; 2) 2013: GFI #213 outlines new guidance to avoid the use of antibiotics as 'growth promotion' while maintaining 'disease prevention.

With Regulation n. 41 of 23 October 2017, Brazil establishes the National Program for the Prevention and Control of Antimicrobial Resistance in Agriculture, "AgroPrevine", which aims to strengthen actions for the prevention and the control of antimicrobial resistance in agriculture, considering the One Health concept. Differently from Brazil, the USA approves some guidelines with the CVM GFI #209 and #213 on the use of antimicrobials in food-producing animals and the voluntary adoption of practices for the appropriate use of antimicrobial drugs of medical importance in food-producing animals, avoiding the use as growth promotion, maintaining the "disease prevention".

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

2.3.2.1 Data and Methodology

The information relating to the MRLs of antibiotics comes from BCGlobal database which contains for each country data relating to the legislation in force and the limits of 499 drugs, including antibiotics, for each product category. Particularly, BCGlobal provides the following information:

a) Current MRLs –MRLs currently in force;
b) Current MRLs: Officially established MRLs that are in force;
c) Pending MRLs: MRL amendments that have been officially approved and will enter force on a specified future date;
d) Proposed MRLs: Draft MRL amendments, or petitions under consideration. New, revised, and revocation proposals. Includes source document reference, published and comment due dates.

Table 5 reports the total number of veterinary drugs regulated by countries:

Table 5: Total Number of Veterinary Drugs regulates by countries.

Country	Total number	Country	Total number	Country	Total number
America Samoa	81	Guam	103	Peru	210
Argentina	81	Guatemala	210	Philippines	81

Fiji	81	Panama	81		

Sources: Authors' computation based on BCGlobal database

From the table clearly emerges that the number of admitted substances is different. Additionally, the limits in terms of MRL are still various.

From BCGlobal we extracted the MRLs of veterinary drugs used in 62 countries, for 11 different product types: buffalo, cattle, chicken, duck, goat, horse, pigeon, rabbit, sheep, pig, and turkey. Our sample includes 35 exporting countries, resulting from grouping countries with the same regulatory references, one importing country (the EU), and the 11 meat products previously mentioned.

The infographics refer to beef, pork, and chicken meat. The list of drugs includes 409 substances between insecticides, antibacterial agent growth promoters, and antimicrobial agents. However, the study focused on a list of 122 antibiotics (table 6).

Table 6: List of Antibiotic included in the BCGlobal database

Antibiotic	Reference class
Amikacin	Aminoglycosides
Amoxicillin	Penicillins
Ampicillin	Penicillins
Apramycin	Aminoglycosides
Aspoxicillin	Amino acid-type penicillin
Avilamycin	Orthosomycin
Avoparcin	Glycopeptides
Bacitracin	Ciclic polipeptides
Baquiloprim	Diaminopyrimidine derivative
Benzylpenicillin	Penicillins
Bicozamycin	Azabicyclic
Bithionol	Synthetic sulfanediyl-bis-dichlorpheno
Carbadox	Quinoxaline-di N oxide
Carbomycin	Macrolides
Cefacetrile	First-generation-cephalosporins

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

Cefadroxil	First-generation-cephalosporins
Cefalexin	First-generation-cephalosporins
Cefalonium	First-generation-cephalosporin
Cefapirin	First-generation-cephalosporins
Cefazolin	First-generation-cephalosporins
Cefoperazone	Third-generation-cephalosporins
Cefquinome	Third-generation-cephalosporins
Ceftiofur	Third-generation-cephalosporins
Cefuroxime	Second-generation-cephalosporins
Chloramphenicol	Amphenicols
Chlortetracycline	Tetracyclines
Ciprofloxacin	Fluoroquinolones
Clavulanic acid	β-lattamic drug
Clindamycin	Lincosamides
Cloxacillin	Penicillins
Colistimethate	Polymyxins
Colistin	Polymyxins
Danofloxacin	Fluoroquinolones
Dapsone	Sulfone
Destomycin A	Aminoglycosides
Dicloxacillin	Penicillins
Difloxacin	Fluoroquinolone
Dihydrostreptomycin	Derivative streptomycin
Doxycycline	Tetracyclines
Efrotomycin	Antibiotic from Streptomyces lactamdurans
Enramycin	Polypeptides
Enrofloxacin	fluoroquinolone carboxylic acid derivatives
Erythromycin	Macrolides

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

Flavomycin	glycophospholipid antibiotic
Florfenicol	Carboxamides
Flumequine	Quinolones
Fosfomycin	Phosphonics
Gamithromycin	Macrolides
Gentamicin	Aminoglycosides
Hetacillin	Penicillins
Josamycin	Macrolides
Kanamycin	Aminoglycosides
Kasugamycin	aminoglycosides
Kitasamycin	Macrolides
Laidlomycin	Lincosamides
Lincomycin	Lincosamides
Lomefloxacin	Fluoroquinolones
Maduramicin	Monoglycoside polyether ionophorous
Marbofloxacin	Third generation fluoroquinolone
Metronidazole	Nitromidazoles
Minocycline	Tetracyclines
Mirosamycin	Macrolides
Nafcillin	Penicillins
Neomycin	Aminoglycosides
Nitrofurantoin	Nitrofuran-derivatives
Norfloxacin	Fluoroquinolones
Novobiocin	aminocoumarin
Ofloxacin	Fluoroquinolones
Olaquindox	Quinolones
Oleandomycin	Macrolides
Orbifloxacin	Fluoroquinolones

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

Ormetoprim	Third-generation cephalosporin
Oxacillin	Penicillins
Oxytetracycline	Tetracyclines
Paromomycin	Aminoglycosides
Penicillin	Penicillins
Phenoxymethylpenicillin	Penicillins
Pirlimycin	Lincosamides
Polymyxin B	Polymyxins
Procaine benzylpenicillin	Penicillins
Rifaximin	Rifamycins
Roxithromycin	Macrolides
Salinomycin	polyether ionophore
Sarafloxacin	Quinolones
Semduramicin	Semduramicin
Sodium sulfachlorpyrazine monohydrate	Sulfonamides
Spectinomycin	Aminocyclitols
Spiramycin	Macrolides
Streptomycin	Aminoglycosides
Sulfabenzamide	Sulfonamides
Sulfacetamide	Sulfonamides
Sulfachlorpyridazine	Sulfonamides
Sulfadiazine	Sulfonamides
Sulfadimethoxine	Sulfonamides
Sulfaethoxypyridazine	Sulfonamides
Sulfaguanidine	Sulfonamides
Sulfamerazine	Sulfonamides
Sulfamethazine (Sulfadimidine)	Sulfonamides
Sulfamethoxazole	Sulfonamides

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

Sulfamethoxypyridazine	Sulfonamides
Sulfamonomethoxine	Sulfonamides
Sulfanilamide	Sulfonamides
Sulfanitran	Sulfonamides
Sulfapyridine	Sulfonamides
Sulfaquinoxaline	Sulfonamides
Sulfathiazole	Sulfonamides
Sulfatroxazole	Sulfonamides
Sulfisoxazole	Sulfonamides
Sulfisozole	Sulfonamides
Sulfomyxin	Sulfonamides
Tetracycline	Tetracyclines
Thiamphenicol	Chloramphenicols
Tiamulin	Pleuromutilin
Tildipirosin	Macrolides
Tilmicosin	Macrolides
Tribromsalan	Salicylanilide derivative
Trimethoprim	Sulfonamides
Tulathromycin	Macrolides
Tylosin	Macrolides
Tylvalosin	Macrolides
Valnemulin	Pleuromutilin
Virginiamycin	Streptogramines

Sources: BC Global Database

Regarding the handling of missing values firstly we checked for the default values and then we adopted the rules detailed in Table 7:

Table 7: Rules for missing values

MRL exporter	MRL importer	Rules

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

Existing > MRL importer	Existing	Max MRL
Existing < MRL importer	Existing	MRL importer
Missing	Existing	Max MRL
Existing	Missing	MRL importer = MRL exporter
Missing	Existing	Max MRL

This is the first study looking at divergences in antimicrobial resistance regulations between the EU and its main trading partners.
We considered a quantitative index expressing the normalized distance between the maximum residual values in the sample countries.

$$D_{ijkh} = \frac{1}{N_h} \left(\sum_{h=1}^{n} exp\left(\frac{MRL_{ikh} - MRL_{jkh}}{MaxMRL_h - MinMRL_h}\right)\right) (2)$$

Where *i* stands for the exporter, *j* for the importer, *k* is the meat products and *h* refers to the antibiotics.
The distance in antibiotics regulations ranges between 0 and 6. A value equal to 0 means that the EU regulation is equal to or less stringent than the regulation of the exporting country. Conversely, a higher value implies a more stringent in the EU.

2.3.2.2 Results

Results emphasize a certain degree of dis-harmonization with the EU rules which affect exports. Therefore, the desired level of standards harmonization surely could impact exports and increase food safety. However, in achieving this goal, the ongoing process of liberalization, through bilateral free trade agreements, should be accompanied by compliance with the standards. This may require a series of accompanying measures, both in relation to technical assistance for the adaptation of farms to hygienic-sanitary standards and in relation to surveillance and control structure. Policies make play a role in coordination efforts and state changes in global norms to support human and animal health.

2.3.3 Updated analysis of Specific Trade Concerns (STCs) submitted to the WTO: analysis of selected law cases

2.3.3.1 The case study analysis on STCs

The Sanitary and Phytosanitary (SPS) Agreement allows WTO members "to provide the level of health protection they deem appropriate" while ensuring that it does not result in unnecessary barriers to international trade. Members are encouraged to use international standards but may adopt higher levels of protection if based on sufficient scientific evidence (risk assessment).

The international standards, guidelines, and recommendations referred to by SPS Agreement are developed by three other international organizations (the so-called "Three sisters"):

1. the Codex Alimentarius Commission,
2. the World Organisation for Animal Health (WOAH),
3. the International Plant Protection Convention (IPPC).

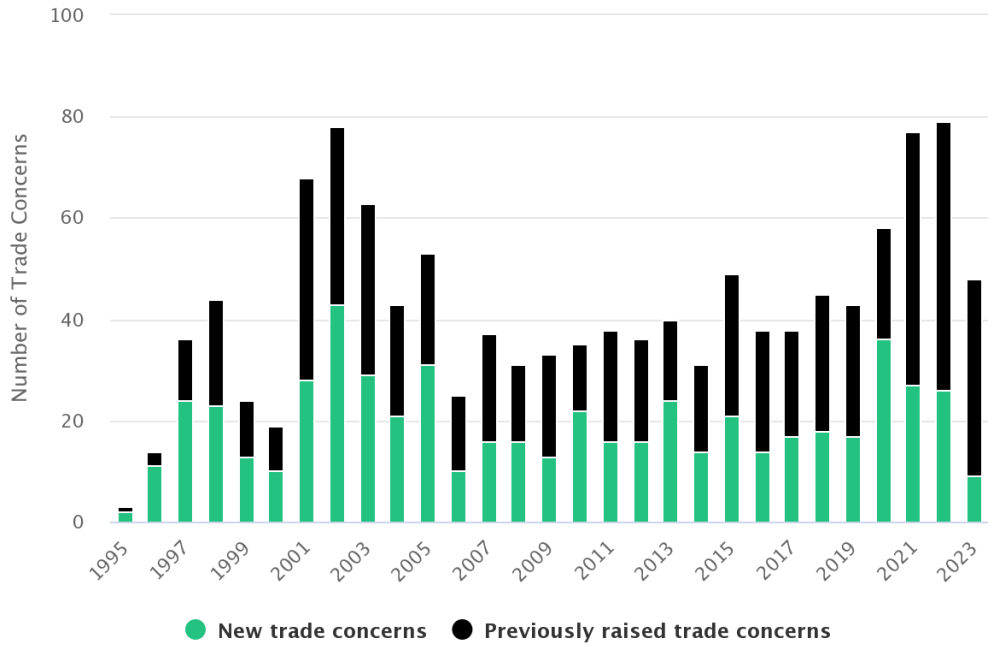

Specific Trade Concerns (STC) are issues raised at the WTO by Countries affected by SPS standards, which they deem particularly restrictive.

The aim of SPS and TBT agreements is to protect consumers and the environment, prevent protectionism, and help industrial standardization, giving technical boundaries for specific products. TBTs and SPSs often impact a product in one or several industries at once by improving trade, by way of better information and increasing confidence among partners or hurting trade by increasing the compliance cost for both exporters and domestic firms and the administrative burden, such as new environmental and production process requirements.

Despite major advances in the development of global standards and common conformity assessment (TBT and SPS Agreements), domestic and import regulations continue to differ from country to country. The number of trade concerns raised by WTO members at the TBT and SPS Committee has grown over time. Discussion of these concerns often allows members to reduce trade tensions before a measure enters into force and helps avoid escalation to a formal dispute. Currently, there are roughly 49.000 TBTs notified compared to 32.370 SPSs (measures for the period 1995-March 2023).

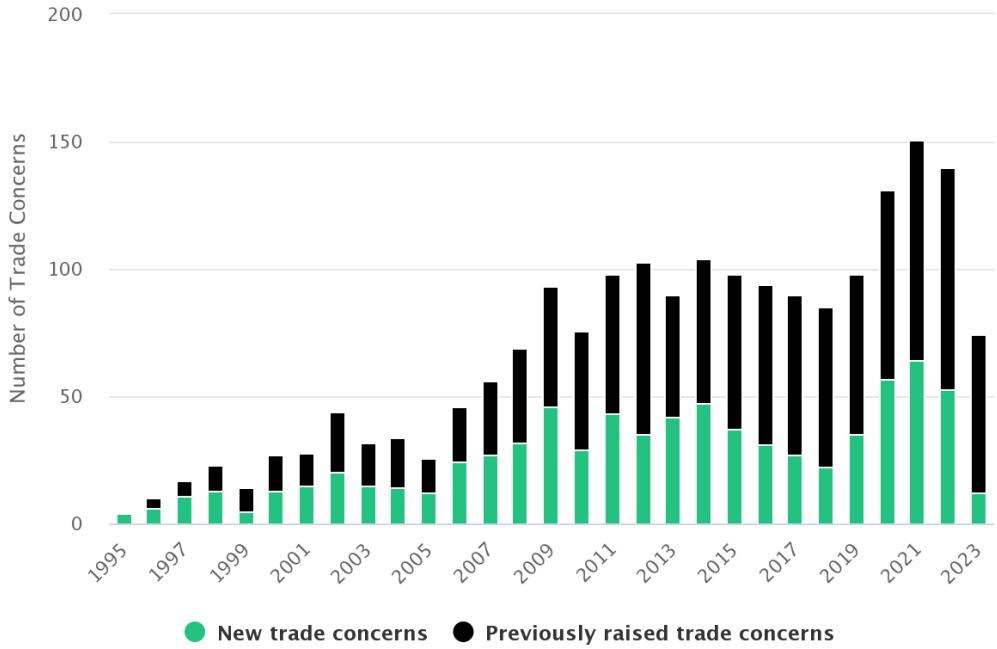

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

The number of SPS, as well as TBTs notifications, has continuously increased, together with the share of notifications submitted by developing countries. The number of STCs was particularly relevant between 2000 and 2005, probably due to the spread of animal disease outbreaks (e.g. BSE, Avian Influenza, etc.).

Each STC provides information on (i) the Country raising the concern and the Country imposing the measure; (ii) the year of the concern; (iii) the product of concern at the HS4 digit level; and (iv) the type of measure and the subject of the concern; (v) the eventual date of the resolution of the concern.

STCs are not formal disputes in the legal sense of the term, but rather a way to seek information about others' implementation of regulation in light of international obligations.

The aim of the analysis of STCs is to identify potential problems that standards and their implementation pose for trade, as perceived by trading partners.

The three STCs analyzed focus on sustainability issues (i.e. food security, food safety, climate change, and animal health) having direct and indirect relevance for the achievement of a number of SDGs.

The STCs analyzed concern two out of "*Three sisters*": WOAH and IPPC. Of these STCs, two were raised by the EU and one sees the EU as a respondent. All STCs are raised orally in the SPS Committee. No dispute has been opened. Progress is summarized by the Secretariat in notes.

The first STC analyzed **concerns about China's import restrictions due to African swine fever (ASF)** because of the lack of recognition of EU regionalization. The sustainability issues involved are animal health and food security which appears significant to meet the SDGs 1 (no poverty) and 3 (zero hunger) given that pork meat is one of the primary sources of animal proteins and China is the first consumer of pig meat in the world. This STC was raised by the EU for the first time in July 2005 and then twelve more times, most recently in November 2022. China is imposing a country-wide ban on imports of pigs and pig products from EU MSs where ASF was detected, not recognizing EU regionalization applied in accordance with international standards established by WOAH (founded as Office International des Épizooties - OIE). Regionalization allows the Country to limit the extension of the disease to a defined restricted area while preserving the status of the remaining territory and the continuation of the trade. The Chinese ban is also maintained on EU MSs that have regained disease-free status according to the WOAH rules. The EU MSs currently affected by the Chinese ban are Poland, Hungary, and Belgium. EU considers Chinese measures overly trade-restrictive. On the other hand, China says the ban, imposed in accordance with the SPS agreement, is necessary considering the ineffective control of the disease by EU MSs with different levels of prevention and control. China highlights that in 2022 some EU MSs still suffer from ASF. China encourages bilateral applications from EU MSs for export licenses on the premise that the risk could be controlled. On December 2021 a regional management agreement for ASF between France and China was signed, becoming the first EU regionalization

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

recognition. The agreement allows France pork exports from unaffected regions even if ASF occurred elsewhere in France.

The second STC **concerns India's Phytosanitary import restrictions, due to the requirement of fumigation with Methyl bromide of plant and plant materials**. The sustainability issue is climate change and the SDGs involved are 1 (no poverty) as the control of pests is fundamental for local producers and 13 (climate action). The STC was raised by European Union and the US (3 times all in 2004), supported by Canada, Chile, and New Zealand. MBr as a fumigant is recognized as an important tool for the control of some quarantine pests of plants and plant-derived materials. At the same time, MBr is a powerful ozone-depleting gas. For these reasons, MBr is regulated by two Multilateral Agreements

1. the Montreal Protocol on Substances that Deplete the Ozone Layer
2. the IPPC

Production and consumption of MBr have been phased out by 2005 for developed countries and by 2015 for developing countries. An exemption to the ban exists for MBr for Quarantine and Pre-Shipment use, considering the necessity of its use where no alternative exists. Countries are, however, encouraged to use alternatives to MBr where they are technically and economically feasible. In the EU, MBr for Quarantine and pre-shipment purposes has been banned (both production and consumption) since March 2010. EU does not allow fumigation with MBr in agricultural exports/imports. In 2022 the STC has been declared partially resolved (as far as the EU is concerned).

The third STC has been raised by **Senegal concerning EU mango imports**. The STC has been raised by Senegal only one time in 2008. The sustainability issues involved are Food safety; food security. All the SDGs interested (1 – no poverty; 2 – zero hunger; 3 – quality education; 5 – gender equality; 8 – decent work and economic growth; 12 – responsible production and consumption) are related to the social and economic importance of mango sector in Senegal. In 2007, the EU rapid alert system warned that the limit for a post-harvest product had been exceeded (there was an interception of fruit fly (that is an invasive pest) in imported mangoes from Senegal). The fruit fly pest is a major threat to the horticulture industry in Africa. The interception of fruit flies on mango imports from Senegal has been numerous and recurring over the years. The mango sector in Senegal has grown dramatically in recent years, both in terms of production and exports, but its potential remains underexploited due to the weakness of the production structures of the main Senegalese-producing regions. To strengthen measures to prevent the introduction and spread of harmful pests and diseases in the EU, on December 2019, a revised EU phytosanitary regime entered into force, imposing additional requirements on all countries exporting mangoes to the EU (a "crop-specific dossiers" is required as a prerequisite for exports to EU that impose a National action plan). Senegal is also working to make the mango sector compliant with the new EU SPS regulation, thanks to international technical assistance programs. In 2022 STC has been declared resolved.

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under grant agreement No 101000551 – TRADE4SD

The three STCs highlight the different perspectives of partners involved in trade concerns. Transparency, science-based, and not-discrimination are the main keys to avoiding unnecessary trade barriers.
To overcome potential problems that standards and their implementation pose for trade are needed 1) enhancing cooperation and exchange of information among trading partners (as suggested by the analysis of EU-China and EU-India STCs); 2) Continuing technical assistance programs, for helping countries to enhance sustainability and compliance to norms and standards, also through effective dialogue and engagement between public and private sectors involving all stakeholders (Senegal); Increasing the level of ambition in bilateral economic and trade relations for sustainable development (China, India).
